

Argos Satellite System - Technical Guide

1. Argos System Overview

The Argos system collects environmental data from autonomous platforms worldwide. In HoubaraTracker, it is used to track the geographic coordinates of deployed PTTs (Platform Transmitter Terminals).

2. Data Ingestion Pipeline

Data is fetched via the Argos SOAP/REST API and pushed to the Firebase backend. Messages include GPS location, Doppler shift data, battery voltage, and activity counters.

3. Location Classes (LC)

Argos assigns a Location Class to each fix indicating accuracy: LC 3 (< 250m), LC 2 (< 500m), LC 1 (< 1500m), LC 0 (> 1500m), and LC A, B, Z for no accuracy estimation.
