

HoubaraTracker v2.1 - User Manual

1. Introduction

Welcome to HoubaraTracker v2.1. This platform provides real-time satellite tracking, GEE spatial analysis, and advanced management for the Asian Houbara Bustard.

2. Dashboard & KPIs

The Dashboard displays real-time key performance indicators including Total Active Transmitters, Birds Tracked, Alerts in the last 24h, and Ingestion Latency from the Argos satellite system. Visual charts display fleet activity and anomaly breakdowns.

3. Live Tracking Module

This module utilizes a Leaflet map integrated with ESRI satellite imagery. You can toggle map layers such as NDVI, SAVI, and LST. The map shows bird positions and generates popups with exact telemetry data.

4. Alerts Management

Alerts are generated automatically for specific anomalies: Distance covered between fixes, geofence breaches, and border crossings. You can acknowledge or resolve these alerts directly.
